# Strength as an alternative to cycles 

Eva Zimmermann<br>Leipzig University

Workshop on Strata
Leipzig, July 20th, 2017

## UNIVERSITAT LEIPZIG

## Main Claim

the complex system of morphologically determined stress in Moses Columbian Salish follows in a cyclic account (Czaykowska-Higgins, 1985, 1993a,b)
the pattern can also be analyzed in an account that is based on grades of activity of underlying phonological elements
$\rightarrow$ cyclic reapplication of stress assignment = competition between elements of different strengths
$\rightarrow$ cyclic vs. representational account?

1. Moses Columbian Salish Stress
2. A cyclic account

## 3. An Account based on Gradient Activity

4. Summary

## Moses Columbian Salish Stress

## Moses Columbian Salish

(Kinkade, 1982; Czaykowska-Higgins, 1985, 1993a,b, 2011; Willett, 2003)
a a single main-stressed syllable in every word
the default-stress position is the rightmost syllable, e.g. for stems in isolation ( $1-\mathrm{a}+\mathrm{b}$ )
prefixes are never stressed; even if they contain the only full V (1-c)
(1) Default stress (Czaykowska-Higgins, 1993a, 205+225)
a. hananík
'jackrabbit'
b. q'aláx
'fence'
c. niiwəpwə́pəlqs
ni1-wp~wp=lqs
Loc-Red-hair=nose
'hair in nose'

## Morphologically determined stress in MCS

hierarchy of stress-preference based on a two-way-distinction of stems and suffixes into:

- dominant ' $D$ ' and recessive ' $R$ ' suffixes
- strong ' S ' and weak 'W' stems
(weak stems=underlyingly vowel-less $\rightarrow$ predictable vowel epenthesis)
$\rightarrow$ D-Sfx $\gg$ S-stem $\gg$ R-Sfx $\gg$ W-stem
© (very similar systems in all Interior Salishan languages (except Lillooet): morphologically determined stress system (Idsardi, 1991; Czaykowska-Higgins and Kinkade, 1998))

## Morphologically determined stress in MCS

(2) a. ncəkcəkqínn
n-ck $\sim c k=q i n-n-t-\varnothing-n$
Loc-Red~hit=Top-Ctr-Tr-3.O-1Sg.S
'I hammered it repeatedly' (215)
b. chaw’jíknəx ${ }^{\text {w }}$

Pac-ћw'j=ikn-mix
Stat-make=back-IPFV
'he's making a bowl' (215)
c. sq'ij'míx
s-q'j' $=$ mix
NMLz-write=people
'school children' (216)
(stem=underlined)

## Further distinction for stems: Extrametricality

E-stems assign extrametricality to the immediately following syllable:

- SE/WE-stems are stressed when followed by one D-suffix
- they loose their stress when followed by more than two D-suffixes or a consonantal suffix and a D-suffix
(3) a. japk ${ }^{\text {wánksn }}$
jap- ${ }^{\mathrm{w}}$ an= $=$ akst-n-t- $\varnothing$-n
Loc-grab=hand-Ctrl-Tr-3.O-1Sg.S
'I grab so. by the hand' (229)
b. $\mathrm{kqk}^{\mathrm{W}}{ }_{\text {ncnáksn }}$
$\mathrm{kq}-\mathrm{k}^{\mathrm{w}}$ an=cin=akst-n-t-ø-n
Loc-grab=mouth=hand-CTRL-Tr-3.O-1Sg.S
'I grab so. by wrist' (231)
c. txatmásq't
t-xat-m=asq't
Loc-raise-MIDDL=day
'sky'

Morphologically determined stress: Summary
(4) Hierarchy of stress preferences
$\rightarrow$ D-Sfx $\gg$ S-stem $\gg$ R-Sfx $\gg$ W-stem
(5) Stress generalizations (Czaykowska-Higgins, 1993a, 235)

|  | S | W | SE | WE |
| :--- | :--- | :--- | :--- | :--- |
| a. | S-R(-R) | W(-R)-R | SE-R(-R) | WE-R |
| b. | S-D | W-D | SE-D | WE-D |
| c. | S-D(-D)-D | W-D(-D)-D | SE-D(-D)-D | WE-D(-D)-D |
| d. | S-D-R(-R) | W-D-R(-R) | SE-D-R(-R) |  |

## Conflicting directionality

if a word contains only epenthetic vowels, the leftmost is stressed
(not uncommon in Interior Salishan; cf. a similar pattern in Thompson River Salish (Thompson and Thompson, 1992; Coelho, 2002))
(6) Leftmost stress in epenthesis-only words
a. sq'ij'q'ijs
s-q'j-q'j-s
NmLz-write-characteristics-Poss
'his/its/her writing' (222)
b. k'ə́məlqstxən
$k^{\prime} m=\mid q s t=x n$
surface.of=shin=leg
'lower leg' (222)

## Summary: The challenges

1. morphological stress system with preference hierarchy:

D-suffixes $\gg$ S-stems $\gg$ R-suffixes $\gg \mathrm{W}$-stems
2. extrametricality effect for E-stems: immediately following D-suffix is always unstressed
3. conflicting directionality: leftmost $V$ stressed if only epenthetic $V$ 's present

## A cyclic account

## General Logic

© Czaykowska-Higgins (1993a): MCS stress follows best in a cyclic account inside the metrical framework of Halle and Vergnaud (1987a,b) (=prominence (*) assigned on different levels: most *'s=main stress)
crucial contrast: cyclic (=D) vs. non-cyclic (=R) suffixes

- D-suffixes trigger cyclic stress deletion and (re)assignment of rightmost stress
- R-suffixes don't trigger stress deletion

## Cyclic D-suffixes: Re-assignment of stress

(7)

|  | $\mathrm{p}^{\prime} \mathrm{iq}_{\mathrm{s}}-\mathrm{cin}_{\mathrm{D}}$ | $\mathrm{p}^{\prime} \mathrm{iq}_{s}-\mathrm{cin}_{\mathrm{D}}-\mathrm{cut}_{\mathrm{D}}$ |  |
| :---: | :---: | :---: | :---: |
| Cycle 1 | p'iq | p'iq |  |
| Stress A: Right | $\stackrel{*}{*}{ }^{*} \mathrm{iq}$ | $\stackrel{*}{*}{ }^{*} \mathrm{iq}$ |  |
| Cycle 2 | $+\mathrm{cin}_{\mathrm{D}}$ | $+\mathrm{cin}_{\mathrm{D}}$ |  |
| Stress Erasure | píq-cin | $\text { píq-cin }^{*}$ | $\rightarrow$ (Re)assignment of stress |
| Stress A: Right | $\text { p'íiq-cin }_{*}^{*}$ | $\text { p'íq-cin }_{\stackrel{*}{*}}^{\stackrel{*}{4}}$ |  |
| Cycle 3 |  | +cut ${ }_{\text {D }}$ |  |
| Stress Erasure |  | píq-ci* ${ }_{\text {* }}$ | $\rightarrow$ (Re)assignment of stress |
| Stress A: Right |  | $\text { p'íq-ciin-cut }_{*}^{*}$ |  |
| Noncyclic |  |  |  |
| Stress A: Right | n/a | n/a |  |
| Stress B: Left | $\mathrm{p}^{*} \stackrel{\stackrel{*}{\mathrm{i}} \mathrm{q}-\mathrm{c}-\mathrm{c}}{\substack{4 \\ \hline}}$ | $\mathrm{p}^{\prime} \mathrm{i} \mathrm{q}-\mathrm{ci}^{\stackrel{*}{n}-\mathrm{cut}} \stackrel{\stackrel{*}{*}}{\substack{4}}$ |  |

## Non-cyclic R-suffixes: No stress deletion

(8)

|  | $\mathrm{p}^{\prime} \mathrm{iq}^{\text {- }} \mathrm{cin}_{\mathrm{D}}-\mathrm{cut}_{\mathrm{D}}-\mathrm{mix}_{\text {R }}$ | patix ${ }^{\text {w }}$ - min $_{\text {R }}$ |  |
| :---: | :---: | :---: | :---: |
| Cycle 1 | p'iq | patix ${ }^{\text {w }}$ |  |
| Stress A: Right | $\stackrel{*}{*} \stackrel{*}{*}^{*}$ | $\text { patix }^{*} \stackrel{*}{*}$ |  |
| Cycle 2 | $+\mathrm{cin}_{\mathrm{D}}$ |  |  |
| Stress Erasure | píq-cin- |  |  |
| Stress A: Right | $\mathrm{p}^{*} \mathrm{i} \mathrm{*}-\stackrel{*}{*} \mathrm{c}$ |  |  |
| Cycle 3 | +cut ${ }_{\text {d }}$ |  |  |
| Stress Erasure | píq-cin-cut |  |  |
| Stress A: Right | $\text { p'iq-cín-cut } \stackrel{*}{*}$ |  |  |
| Noncyclic | +mix ${ }_{\text {R }}$ | $+\mathrm{min}_{\mathrm{R}}$ |  |
| Stress A: Right | p'íiq-cin ${ }^{*}{ }^{*}$ *ut-mix | $\text { patio }^{*} \stackrel{*}{*}-\text { min }$ | $\rightarrow$ No stress deletion |
| Stress B: Left | p,íiq-cin $\stackrel{*}{*} \stackrel{*}{*} \stackrel{*}{*}$ | $\text { patix }^{\stackrel{*}{*}} \stackrel{\stackrel{*}{*}-\text { min }}{*}$ |  |

## Conflicting directionality? Epenthesis comes too late

if no underlying vowel is present: no stress can be assigned in cyclic phonology since there are no stressable elements
vowel insertion (VI) applies non-cyclically before leftmost word stress rule (=stress A) but after rightmost stress rule (=stress B)
(9)

|  | 2 ${ }^{\text {w }}$ ? |  |
| :---: | :---: | :---: |
| Cycle 1 | ? ${ }^{\text {w }}$ ? |  |
| Stress A: Right | n/a |  |
| Noncyclic |  |  |
| Stress A: Right | n/a |  |
| Vowel Epenthesis | ?əち ${ }^{\text {a }}$ ? | $\rightarrow$ V-epenthesis after Stress A: Right |
| Stress B: Left | $\stackrel{*}{\stackrel{*}{*}} \stackrel{+}{?^{*}} \mathrm{n}^{\mathrm{w}} \mathrm{a} \text { ? }$ |  |

## Extrametricality

stems can assign extrametricality to an adjacent suffix
(10) Extrametricality
$[\text { Root }]_{[+E x t r]}-$ Suffix $\rightarrow[\text { Root }]_{[+E x t r]}-<$ Suffix $>$

## Strong stem and extrametricality

| (11) | $\mathrm{x}^{\mathrm{w}} \mathrm{ir}_{\text {SE }}-\mathrm{akst}{ }_{\text {d }}$ | $\mathrm{x}^{\mathrm{w}} \mathrm{ir}_{\text {SE }}-\mathrm{akst}_{\text {d }}-\mathrm{atk}^{\mathrm{w}}{ }_{\text {D }}$ |  |
| :---: | :---: | :---: | :---: |
| Cycle 1 | $\mathrm{x}^{\text {w }}$ ir | $\mathrm{x}^{\text {w }}$ ir |  |
| Stress A: Right | $\begin{array}{r} \stackrel{*}{*} \\ \mathrm{x}_{\mathrm{w}} \mathrm{i} \\ \hline \end{array}$ | $\begin{array}{r} * \\ x^{*}{ }^{*} \\ \hline \end{array}$ |  |
| Cycle 2 | +akst | +akst |  |
| Stress Erasure | $\mathrm{x}^{\text {w }}$ i r -akst | $\mathrm{x}^{\text {w }}$ i r -akst |  |
| EM | $\mathrm{xw}^{\text {wir-akst }}$ | $\begin{gathered} \mathrm{x}^{\mathrm{w}} \mathrm{ir}-\mathrm{akst} \end{gathered}$ | $\rightarrow$ Adj.Sfx invisible for stress |
| Stress A: Right | $\begin{array}{r} \stackrel{*}{*}<*> \\ \mathrm{x}_{\mathrm{ir}}^{*}-\mathrm{akst} \end{array}$ | $\begin{gathered} \stackrel{*}{*}<*> \\ \text { wir-akst }^{*} \end{gathered}$ |  |
| Cycle 3 |  | +atk ${ }^{\text {w }}$ |  |
| Stress Erasure |  | $\mathrm{x}^{\mathrm{w}_{\mathrm{ir}}^{*}-\mathrm{akst}}{ }^{*}-\mathrm{atk}$ | $\rightarrow$ 2nd D-Sxf. deletes stress |
| EM |  | n/a |  |
| Stress A: Right |  | $\mathrm{x}^{\mathrm{w}_{\mathrm{ir}}^{*}-\mathrm{akst}-\text {-atk }} \stackrel{*}{*}$ |  |
| Noncyclic |  |  |  |
| Stress A: Right | $\begin{gathered} \stackrel{*}{*}<*> \\ x^{w_{i r}^{*}-a k s t} \end{gathered}$ | $\text { x"wir-akst-atk }_{\stackrel{*}{*}}^{\stackrel{*}{*}}$ |  |
| Stress B: Left | $\begin{gathered} \stackrel{*}{*} \\ \stackrel{*}{w^{*}}<{ }^{* *} \\ \mathrm{x}_{\mathrm{ir}-\mathrm{aks}} \end{gathered}$ |  |  |

## Account in Czaykowska-Higgins (1993a): Summary of assumptions

1. suffixes are cyclic or not
2. different stress rules assigning left- or rightmost stress
3. extrametricality can be assigned to adjacent morphemes

## An Account based on Gradient Activity

## Background: Gradient Symbolic Representations

(Smolensky and Goldrick, 2016; Rosen, 2016; Faust and Smolensky, 2017; Zimmermann, 2017)
e phonological elements can have different degrees of presence in an underlying representation, expressed as numerical activities (departure adopted here: elements can be weakly active in the output)
computation: Harmonic Grammar (Legendre et al., 1990; Potts et al., 2010)
any change in activity is a faithfulness violation
(12) Toy example: Weak activation and HG constraint evaluation

| $\mathrm{p}_{1} \mathrm{a}_{1} \mathrm{k}_{0.6} \mathrm{t}_{1}$ | DeP <br> 3 | $\left.{ }^{\mathrm{C}} \mathrm{CC}\right]_{\sigma}$ <br> 2 | Max <br> 1 |  |
| :---: | :---: | :---: | :---: | :---: |
| a. $\mathrm{p}_{1} \mathrm{a}_{1} \mathrm{k}_{0.6}$ |  |  | -1 | -1 |
| b. $\mathrm{p}_{1} \mathrm{a}_{1} \mathrm{t}_{1}$ |  |  | -0.6 | -0.6 |
| c. $\mathrm{p}_{1} \mathrm{a}_{1} \mathrm{k}_{0.6} \mathrm{t}_{1} \partial_{1}$ | -1 |  |  | -3 |
| d. $\mathrm{p}_{1} \mathrm{a}_{1} \mathrm{k}_{0.6} \mathrm{t}_{1}$ |  | -0.6 |  | -1.2 |

## The analysis in a nutshell: Competition

morphemes have no or underlying feet of different strengths: competion about $\varphi$-realization and most active one wins
only difference between strong and weak stems: former has an underlying vowel, avoiding violations of (13-b)
(13) Representations

| Fully active $\varphi:$ SE/WE |  | Weaker $\varphi: D$ | Weakest $\varphi: S$ | No $\varphi: R / W$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\varphi_{1}$ | $\varphi_{1}$ | $\varphi_{0.8}$ | $\varphi_{0.6}$ |  |  |
| SE | WE | D | S | R | W |

(14) a. MAX- $\varphi$ :

Assign a violation mark for every input $\varphi$ without an output correspondent.
b. *ə́:

Assign a violation mark for every main-stressed colourless V .

## The analysis in a nutshell: Gang effect

e apparent extrametricality is a gang-effect in HG: There is a preference for stems to be stressed but stress can't be too far away from the right edge (=seperated from the right edge by more than one morpheme)
(15) $\quad$ a. $\varphi>\Sigma$ :

Assign a violation mark for every main-stressed vowel that is not preceded and followed by stem-segments.
b. $\quad \mathrm{RM}_{\mathrm{Cos}}$ :

Assign a violation mark for every morphemic colour $\alpha$ that intervenes between the right word edge and the stressed vowel that is not of morphemic colour $\alpha$.

## The analysis in a nutshell: Morphological affiliation

ce apparent conflicting directionality follows from contrast between coloured/epenthetic material: There is a preference for stems to be stressed and $\mathrm{RM}_{\mathrm{V}}$ does not count epenthetic vowels
(16) $\quad R M_{V}$ :

Assign a violation mark for every non-epenthetic vowel that intervenes between the right word edge and a stressed vowel.

## SE and R: Realization of the only underlying $\varphi$

(17)

| $\begin{aligned} & \varphi_{1} \\ & \mathrm{SE} \end{aligned}$ |  |  | Max- $\varphi$ <br> 100 | $\begin{gathered} \varphi>\Sigma \\ 30 \end{gathered}$ | $\begin{gathered} \mathrm{RM}_{\mathrm{V}} \\ 30 \end{gathered}$ | $\mathrm{RM}_{\mathrm{CoL}}$ <br> 12 | $\begin{gathered} \text { *ó } \\ 5 \end{gathered}$ | Dep- $\varphi$ <br> 5 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| re | $\varphi_{1}$ <br> SE |  |  |  |  | -1 |  |  | -12 |
| b. | SE | $\varphi_{1}$ R | -1 | -1 |  |  | -1 | -1 | -140 |

(epenthetic=grey background)

W, D, and R: Realization of the only underlying $\varphi$
(18)

| $\begin{gathered} \varphi_{0.8} \\ \mathrm{~W} \\ \mathrm{D} \end{gathered} \mathrm{R}$ | MAX- $\varphi$ $100$ | $\begin{gathered} \varphi>\Sigma \\ 30 \end{gathered}$ | $\begin{gathered} \mathrm{RM}_{\mathrm{V}} \\ 30 \end{gathered}$ | $\mathrm{RM}_{\mathrm{CoL}}$ <br> 12 | $\begin{gathered} \text { *ó } \\ 5 \\ \hline \end{gathered}$ | Dep- $\varphi$ <br> 5 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| a. $\varphi_{1}$ $\square$ W D R | -1.6 |  | -1 | -2 | -1 | -1 | -224 |
| W. W D $\quad \varphi_{0.8}$ |  | -1 |  | -1 |  |  | -42 |
| c. <br> W $\quad \mathrm{D} \quad \mathrm{Q}_{1}$ | -0.8 | -1 |  |  | -1 | -1 | -120 |

## WE and D: Preservation of $\varphi$ with highest activity

(19)

| $\begin{array}{cc} \varphi_{1} & \varphi_{0.8} \\ \text { WE } & D \end{array}$ | Max- $\varphi$ <br> 100 | $\begin{gathered} \varphi>\Sigma \\ 30 \end{gathered}$ | $\begin{gathered} \mathrm{RM}_{\mathrm{V}} \\ 30 \end{gathered}$ | $\begin{gathered} \mathrm{RM}_{\mathrm{CoL}} \\ 12 \end{gathered}$ | $\begin{gathered} \text { *ə́ } \\ 5 \end{gathered}$ | $\begin{gathered} \text { Dep- } \varphi \\ 5 \end{gathered}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{array}{lc}  & \varphi_{1} \\ \\ W E & D \end{array}$ | -0.8 |  | -1 | -1 | -1 |  | -127 |
| b. WE ${ }^{\varphi 0.8}$ | -1 | -1 |  |  |  |  | -130 |

## Apparent extrametricality

a gang effect arises if more than one D-suffix follows an E-stem:

- in principle, $\varphi>\Sigma$ and Max- $\varphi$ prefer realization of stress on an E-stem over realization on a D-suffix (20-a)
- if more than one D-suffix follows, however, $\mathrm{RM}_{\mathrm{CoL}}$ and $\mathrm{RM}_{\mathrm{V}}$ gang up: the stress would be too far away from the right edge and realization of stress on the suffix becomes optimal (20-b)
(20) Threshold effect for E-stems: A gang effect
... has a higher weight than...
a. $0.2 \times \operatorname{MAX}-\varphi+\varphi>\Sigma>R M_{C o L}+\mathrm{RM}_{V}$
b. $2 \times \mathrm{RM}_{\mathrm{CoL}}+(2 \mathrm{x}) \mathrm{RM}_{\vee} \gg 0.2 \times \mathrm{MAX}-\varphi+\varphi>\Sigma$

## SE and D: Preservation of $\varphi$ with highest activity

(21)

| $\begin{array}{ll} \varphi_{1} & \varphi_{0.8} \\ \text { SE } & D \end{array}$ | $\begin{gathered} \text { МАХ- } \varphi \\ 100 \end{gathered}$ | $\begin{gathered} \varphi>\Sigma \\ 30 \end{gathered}$ | $\begin{gathered} R M_{V} \\ 30 \end{gathered}$ | $\begin{gathered} \mathrm{RM}_{\mathrm{CoL}} \\ 12 \end{gathered}$ | $\begin{aligned} & \text { *á } \\ & 5 \end{aligned}$ | Dep- $\varphi$ <br> 5 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{array}{lll}  & \varphi_{1} \\ & \mathrm{SE} & \mathrm{D} \end{array}$ | -0.8 |  | -1 | -1 |  |  | -122 |
| b. $\quad \mathrm{SE} \quad \varphi_{0.8}$ | -1 | -1 |  |  |  |  | -130 |

## SE and multiple D's: $\mathrm{RM}_{\mathrm{CoL}}$ and $\mathrm{RM}_{\mathrm{V}}$ gang up against $\operatorname{MAx}-\varphi$ and $\varphi>\Sigma$

(22)

| $\begin{array}{ccc} \varphi_{1} & \varphi_{0.8} & \varphi_{0.8} \\ \text { SE } & \mathrm{D} & \mathrm{D} \end{array}$ | Max- $\varphi$ <br> 100 | $\begin{gathered} \varphi>\Sigma \\ 30 \end{gathered}$ | $\begin{gathered} R M_{V} \\ 30 \end{gathered}$ | $\mathrm{RM}_{\mathrm{CoL}}$ $12$ | $\begin{gathered} \text { *á } \\ 5 \end{gathered}$ | $\begin{gathered} \text { Dep- } \varphi \\ 5 \end{gathered}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| a. $\begin{array}{lll} \hline \varphi_{1} & & \\ S E & D & D \end{array}$ | -1.6 |  | -2 | -2 |  |  | -244 |
|  | -1.8 | -1 | -1 | -1 |  |  | -252 |
|  | -1.8 | -1 |  |  |  |  | -210 |

## SE and D and an intervening unstressed suffix: Stress on D

(23)

| $\varphi_{1}$  $\varphi_{0.8}$ <br> SE $C$ $D$ <br> xat m asq't | $\operatorname{Max}-\varphi$ $100$ | $\varphi>\Sigma$ $30$ | $\mathrm{RM}_{\mathrm{V}}$ | $\mathrm{RM}_{\mathrm{CoL}}$ $12$ | *ə́ <br> 5 | $\text { Dep- } \varphi$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| a. SE C D <br> xat $m$ asq't | -0.8 |  | -1 | -2 |  |  | -134 |
| b.SE $C$ $D$ <br> xat $m$ asq't | -1 | -1 |  |  |  |  | -130 |

## Conflicting directionality

in the absence of underlying stress, default rightmost stress is predicted (24-a)
ia if there are no underlying vowels, leftmost stress on the stem is predicted since $\varphi>\Sigma$ prefers leftmost stress and no violations of $\mathrm{RM}_{V}$ are induced by potentially following epenthetic vowels (24-b)
(24) 'Conflicting Directionality' = the invisibility of epenthetic vowels

$$
\begin{align*}
& \text {... has a higher weight than... } \\
& \text { a. } \mathrm{RM}_{\mathrm{CoL}}+\mathrm{RM}_{\mathrm{V}}+{ }^{*} \text { ó } \ggg \Sigma \\
& \text { b. } \varphi>\Sigma \quad \gg 2 \times \text { RM }_{\text {CoL }} \tag{25}
\end{align*}
$$

W and R: no underlying vowels
(25)

| $\begin{array}{ccc} \text { k'm } & \text { lqst } & \text { xn } \\ \text { W } & R & R \end{array}$ | MAX- $\varphi$ <br> 100 | $\begin{gathered} \varphi>\Sigma \\ 30 \end{gathered}$ | $\begin{gathered} R M_{V} \\ 30 \end{gathered}$ | $\mathrm{RM}_{\mathrm{CoL}}$ <br> 12 | *́j | $\text { Dep- } \varphi$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | -2 | -1 | -1 | -34 |
| b. $\square$ |  | -1 |  |  | -1 | -1 | -40 |

## Summary

## Summary

the morphological stress system in MCS follows in an account that is based on grades of activity of underlying phonological elements
$\rightarrow$ a representational reanalysis of apparent cyclic effects is possible based on true competition in a parallel model:

- To which degree is such an account generalizable?
- Is the independent evidence for GSR convincing and the reanalysis hence desirable?
se strengthens the claim for GSR which so far has been argued to account for exceptional/morpheme-specific segmental effects (Smolensky and Goldrick, 2016; Rosen, 2016; Faust and Smolensky, 2017) - true competition is straightforwardly expected
