

# **The typology of multiple reduplication – an argument for a prosodic affixation account**

Eva Zimmermann  
UBC Vancouver

University of Victoria  
Linguistics Colloquium  
April 12th, 2018

What can multiple reduplication tell us about the theoretical account of reduplication and the phonology-morphology interface?

(1) *Multiple Reduplication*

The presence of more than one reduplicative morpheme in a word.

## Main Claim today

- if more than one reduplicative morpheme is present in a single word, three patterns can be observed in the languages of the world
  - all reduplicants surface as expected
  - **only a single reduplicant** surfaces
  - all reduplicants surface but one is **smaller than expected**
- a **purely phonological account based on prosodic affixation** predicts this typology without recourse to reduplication- or morpheme-specific mechanisms
- avoidance or truncation of multiple reduplication is then simply the avoidance of too many unfaithful phonological repair operations

## Two competing forces

‘The languages of the world frequently show evidence of conspiracies to **avoid the ‘accidental’ repetition** of phoneme strings across morphs. These conspiracies are intriguing, since many languages also use the contrary strategy of reduplication – which **deliberately repeats** material within morphs.’ (Menn and McWhinney, 1984, 519; my emphasis)

# Outline

## 1. Data

- 1.1 The typology of multiple reduplication
- 1.2 Avoidance of multiple reduplication
- 1.3 Truncatory multiple reduplication
- 1.4 Extending the focus: Pseudoreduplication
- 1.5 Summary of the Typology

## 2. A phonological Account of Reduplication

- 2.1 Theoretical Background
- 2.2 Deriving the Typology: Avoidance
- 2.3 Deriving the Typology: Truncation
- 2.4 Deriving the Typology: Pseudoreduplication

## 3. BR-Faith Alternative

## 4. Conclusion

# Data

## Multiple reduplication: Tagalog example

- full reduplication marks plural and /CV-/ reduplication imperfective in (2-a)
- a verb can be marked for both plural (actor) and imperfective by combining both reduplications (2-b+c)

### (2) *Reduplication in Tagalog (Mattes, 2007, 126)*

- a. nag-**du**~duman          siya    **bulan**~bulan  
 BEG.AV-IPFV~DEM.DIST 3.SG.AF PL~month  
 ‘S/he goes there every month’
- b. ini          an **ha**~**hanap**~hanap-on  
 DEM.PROX PB IPFV~PL~look.for-UG  
 ‘here (they are) continuously searching’

## Excluded (for now): Multiple full reduplication

- intensifying reduplication in Taiwanese affects only monosyllabic adjectives

(3) *Taiwanese, Sino-Tibetan (Zhang and Lai, 2007, 34)*

	‘somewhat A’	‘very A’	
$p^h oŋ^{21}$	$p^h oŋ^{51} \sim p^h oŋ^{21}$	$p^h oŋ^{51} \sim p^h oŋ^{51} \sim p^h oŋ^{21}$	‘blown-up’
$sin^{55}$	$sin^{33} \sim sin^{55}$	$sin^{35} \sim sin^{33} \sim sin^{55}$	‘new’
$kaw^{33}$	$kaw^{21} \sim kaw^{33}$	$kaw^{35} \sim kaw^{21} \sim kaw^{33}$	‘thick’

## Languages with multiple reduplication

<b>Tigre</b>	Afro-Asiatic	Semitic	(Rose, 2003)
<b>Arapaho</b>	Algic	Algonquian	(Cowell and Moss, 2008)
<b>Fox</b>	Algic	Algonquian	(Dahlstrom, 1997)
<b>Plains Cree</b>	Algic	Algonquian	(Ahenakew and Wolfart, 1983)
<b>Bikol</b>	Austronesian	Malayo-Polynesian	(Donner, 2012)
<b>Mokilese</b>	Austronesian	Malayo-Polynesian	(Harrison, 1974)
<b>Nukuoro</b>	Austronesian	Malayo-Polynesian	(Carroll, 1965)
<b>Papapana</b>	Austronesian	Malayo-Polynesian	(Smith, 2016)
<b>Sikaiana</b>	Austronesian	Malayo-Polynesian	(Donner, 2012)
<b>Tagalog</b>	Austronesian	Malayo-Polynesian	(Blake, 1917)
<b>Thao</b>	Austronesian	Western Plains	(Blust, 2001)
<b>Klamath</b>	Klamath-Modoc		(Barker, 1964; Zoll, 2002)
<b>Colville</b>	Salishan	Interior Salish	(Mattina, 1973)
<b>Lillooet</b>	Salishan	Interior Salish	(van Eijk, 1997)
<b>Shuswap</b>	Salishan	Interior Salish	(Kuipers, 1974)
<b>Spokane</b>	Salishan	Interior Salish	(Bates and Carlson, 1998)
<b>Thompson</b>	Salishan	Interior Salish	(Thompson and Thompson, 1992)
<b>Lushootseed</b>	Salishan	Central Salish	(Urbanczyk, 2001)
<b>Mainland Comox</b>	Salishan	Central Salish	(Watanabe, 1994)
<b>Ahousaht*</b>	Wakashan	S. Wakashan	(Kim, 2003b)
<b>Ditidaht*</b>	Wakashan	S. Wakashan	(Stonham, 1994)
<b>Kyuoquot*</b>	Wakashan	S. Wakashan	(Rose, 1981)
<b>Makah*</b>	Wakashan	S. Wakashan	(Davidson, 2002)
<b>Tsishaath*</b>	Wakashan	S. Wakashan	(Stonham, 2004)

## The typology of multiple reduplication

## The 'nothing exciting' pattern

	stem+morpheme:
tu~turoga	R1
turo~turoga	R2
tu~turo~turoga	R2 + R1

### The faithful pattern

Both R1 and R2 surface in exactly the form in which they surface in isolation.

## A. Faithful multiple reduplication in Thompson

(4) *Multiple reduplication in Thompson (Broselow, 1983, 162)*

a. sí~sil'

DIM-calico

'a little piece of calico'

b. sil~síl

DISTR-calico

'patches of calico'

c. sil~sí~sil'

DIM-DISTR-calico

'small patches of calico'

## A. Faithful multiple reduplication in Fox

- /Ca:/Ce:-/ reduplication marks the continuative (5-b), bisyllabic reduplication the continuative (5-c), and both can be combined (5-d)

(5) *Multiple reduplication in Fox (Dahlstrom, 1997, 206+207)*

- |    |                         |                                      |
|----|-------------------------|--------------------------------------|
| a. | wi:tamaw-e:wa           | ‘he tells him’                       |
| b. | wa:~wi:tamaw-e:wa       | ‘he tells him over and over’         |
| c. | wi:ta~wi:tamaw-e:wa     | ‘he keeps telling him’               |
| d. | wa:wi~wa:~wi:tamaw-e:wa | ‘he keeps telling him over and over’ |

## Avoidance of multiple reduplication

## The 'avoidance' pattern

	stem+morpheme:
tu~turoga	R1
turo~turoga	R2
turo~turoga	R2 + R1

### The avoidance pattern

Only a single reduplicant surfaces although R1 and R2 are present.

Additional complication: independent evidence that R1 is indeed present!

## Avoidance in Ahousaht

- some meanings are expressed by reduplication alone (6-a), e.g. PL
- many suffixes trigger prefixing reduplication (=underlined) (6-b)

(6) *Ahousaht* (Kim, 2003b, 136+138)

- a.
- |           |                 |             |
|-----------|-----------------|-------------|
| maḥti:    | ‘house’         |             |
| ma~maḥti: | ‘houses’        | (PL-maḥti:) |
| naʔa      | ‘to hear’       |             |
| na~naʔa   | ‘to understand’ | (DER-naʔa)  |

- b.
- |                            |  |
|----------------------------|--|
| mi~miḥkʷukʔicu:ʃ           |  |
| miḥ- <u>kʷukʔ</u> -ʔitʃu:ʃ |  |
| same-to.resemble-2PL.IND   |  |
| ‘both of you look alike’   |  |

## Avoidance in Ahousaht (Kim, 2003a,b, 2008)

- two reduplicative morphemes in a word = **a single reduplicant**

(7) *Ahousaht* (Kim, 2003b, 138)

a. na~naʔak'ukʔijf      (\*na~na~naʔak'ukʔijf)

DER-naʔa-k'uk-ʔijf

DER-to.hear-to.resemble-3SG.IND

's/he seems to be knowledgeable'

b. t'u~t'uc'i:ḥ      (\*t'u~t'u~t'uc'i:ḥ)

PL-t'uc'(up)-i:ḥ

PL-sea.urchin-to.gather/fish

'gathering more than one sea urchin'

## Avoidance in Kyuquot

- two reduplicative morphemes in a word = **a single reduplicant** (8-b)

(8) *Kyuquot* (Rose, 1981; Stonham, 2004)

a.	tʰuk- <u>as</u>	tʰu:~tʰuk <sup>w</sup> as	‘He has wide wrists’	R312
	mitx <sup>w</sup> -ʃi(tʰ)- <u>apa</u>	mi:~mi:txʃitʰap	‘He turned too much’	R325
	?u- <u>ħw</u> ’aʃ- <u>apa</u>	?u:~?u:ħw’aʃap	‘He used it too much’	R340
b.	m’aʃ- <u>as-apa</u>	m’a:~m’a:ʃʔasap	‘He has really cold wrists’	R341
	tʰ’uk- <u>a:n</u> ’uʃ- <u>apa</u>	tʰ’u:~tʰ’u:k <sup>w</sup> an’ʃap	‘His legs are really big’	R341
	pumaʃ- <u>suʃ</u> - <u>apa</u>	pu:c-pu:maʃ-suʃ-ap	‘He has really itchy eyes’	R341
	mitx <sup>w</sup> - <u>as-st</u> ’aʃ	mi:~mitw’isst’aʃ	‘They were twisting each others wrists’	R342

## Avoidance in Southern Wakashan: The superset effect for the survivor

‘the effects on the final form are those that are required by *all* the triggers, with the proviso that only a single copy occurs’ (Stonham, 2004, 137)

- multiple reduplicant avoidance = surfacing reduplicant **has the maximal shape that combines the shape requirements of both reduplicative morphemes**

(9) *Tsishaat Nuuchahnult* (Stonham, 2004, 137)

a.	tʰuk-a:n'uʎ- <u>apa</u>	<b>R+L &amp; RL+L</b>		tʰu:-tʰu:k <sup>w</sup> an'ʎap	<b>RL+L</b>
b.	m'aʎ- <u>as-apa</u>	<b>RL &amp; RL+L</b>		m'a:-m'a:ʎʎasap	<b>RL+L</b>
c.	pumaʎ- <u>suʎ-apa</u>	<b>Rc+L &amp; RL+L</b>		pu:c-pu:maʎ-suʎ-ap	<b>RLc+L</b>
d.	hin- <u>as-tʃ</u> 'ap-ajuk	<b>RL &amp; R</b>		hi:~hinʎastʃpajk	<b>RL</b>

(Caveat: apparent counterexamples in Kyuquot; all involve the same RcL suffix.)

## Sidenote: Avoidance in Wakashan (Stonham, 1994, 2004, 2007)

- multiple reduplication surfaces if derivational/inflectional reduplicative morphemes are combined
- ➔ follows in a **stratal** model of grammar: multiple reduplication is only avoided within one stratum
- additional phonological evidence for different strata based on behaviour of affixes with respect to lenition, glottalization, ...

## Truncatory multiple reduplication

## The 'smaller than expected' pattern

	stem+morpheme:
tu~turoga	R1
turo~turoga	R2
tu~tu~turoga	R2 + R1

### The truncatory pattern

One of the reduplicants is smaller than its form in isolation.

## Truncatory multiple reduplication in Sikaiana

- two reduplication patterns: a bisyllabic one for the repetitive and a /CV-/ reduplication for plural that can optionally be reduced to /C-/

(10) *Repetitive reduplication* (Donner, 2012, 23)

one time	repeated	
sopo	sopo~sopo	'jump'
sepu	sepu~sepu	'dive'
motu	motu~motu	'snap'

(11) *Plural reduplication* (Donner, 2012, 23)

SG	PL	Optional elided form	
sopo	so~sopo	s~sopo	'jump'
sepu	se~sepu	s~sepu	'dive'
moe	mo~moe	m~moe	'sleep'
anu	a~anu		'dance'

## Truncatory multiple reduplication in Sikaiana

- repeated action of plural subjects results in double reduplication
- the plural reduplicant is now obligatorily /C-/, it cannot be /CV-/

(12) *Repetitive and plural subjects (Donner, 2012, 24)*

SG	PL.REP		
sopo	sopo~s~sopo	'jump'	*sopo~so~sopo
sepu	sepu~s~sepu	'dive'	*sepu~so~sepu

## Extending the focus: Pseudoreplication

## Pseudoreplication

- an apparently reduplicated word but the stem alone does not exist without reduplication

(13) *Ahousaht* (Kim, 2003b, 138)

kakaw'in 'killer whale'

pi:ʃpiʃ 'cat'

mu:smu:s 'cow'

ma:ma:ti 'bird'

## Avoidance for Pseudoreduplication in Ahousaht

- pseudoreuplicated stems (found in many loans) block reduplication

(14) *Ahousaht* (Kim, 2003b, 138)

a. *Pseudoreuplicated stems*

kakaw'in 'killer whale'

pi:ʃpiʃ 'cat'

mu:smu:s 'cow'

ma:ma:ti 'bird'

(Kim, 2003b, 137)

b. *Added suffixes: /k'uk-ʔiʃ/ 'to.resemble-3SG.IND'*

kakaw'ink'ukʔiʃ 'It looks like a killer whale' \*ka~kakaw'ink'ukʔiʃ

pi:ʃpiʃk'ukʔiʃ 'It looks like a cat' \*pi~pi:ʃpiʃk'ukʔiʃ

ma:ma:tik'ukʔiʃ 'It looks like a bird' \*ma~ma:maati

## Avoidance for Pseudoreplication in Ditidaht

- some pseudoreuplicated stems block reduplication but not all (15-b):

(15) *Pseudoreuplicated stems in Ditidaht (Stonham, 2003, 248+247)*

	underlying	surface	
a.	kakaw'ad	kakaw'ad	'killer whale'
	kakaw'ad- <u>ataχ</u>	kakaw'adataχ	'hunting killer whale'
		*ka~kakaw'adataχ	
b.	mu:smus	mu:smus	'cow'
	mu:smus- <u>ataχ</u>	mu:~mu:smusataχ	'hunting cows'
		*mu:smusataχ	

## Truncatory Pseudoreduplication in Manam

- if the base already ends in two identical syllables, the usually  $\varphi$ -sized reduplicant is only one syllable (Buckley, 1997)
- (similar pattern in Samoan (de Lacy, 1999; Nevins, 2012))

### (16) *Pseudoreuplicated stems in Manam (Lichtenberk, 1983, 599-602)*

#### a. $\varphi$ -reduplication

laba	‘be big’	laba~laba	‘older person’
salaga	‘be long’	salaga~laga	‘long’ Sc
sapara	‘branch’	sapara~para	‘having branches’
ʔulan	‘desire’ (V)	ʔulan~lan	‘desirable’

#### b. $\sigma$ -reduplication if stem ends in identical syllables

ragogo	‘be warm’	ragogo~go	‘warm’	*ragogo~gogo
ʔoʔo	‘be plentiful’	ʔoʔo~ʔo	‘many, much’	*ʔoʔo~ʔoʔo
rere	‘like’	rere~re	‘like’	*rere~rere
lele	‘look for’	lele~le	‘look for’	*lele~lele

## Summary of the Typology

Summary: The Unfaithful Patterns **Avoidance** and **Truncatory**(17) *True multiple reduplication*

<b>Sikaiana</b>	Austronesian	Malayo-Polynesian	(Donner, 2012)
<b>Kyuoquot</b> *	Wakashan	S. Wakashan	(Rose, 1981)
<b>Makah</b> *	Wakashan	S. Wakashan	(Davidson, 2002)
<b>Ditidaht</b> *	Wakashan	S. Wakashan	(Stonham, 1994)
<b>Tsishaath</b> *	Wakashan	S. Wakashan	(Stonham, 2004)

(18) *Pseudoreuplicated stems*

<b>Manam</b>	Austronesian	Malayo-Polynesian	(Donner, 2012)
<b>Ditidaht</b> *	Wakashan	S. Wakashan	(Stonham, 1994)
<b>Tsishaath</b>	Wakashan	S. Wakashan	(Stonham, 2004)

(\*some)

# A phonological Account of Reduplication

## Theoretical Background

## Reduplication and prosodic affixation (=PA)

(Marantz, 1982; Pulleyblank, 2009; Saba Kirchner, 2010, 2013*a,b*; Bye and Svenonius, 2012; Bermúdez-Otero, 2012)

reduplicative morpheme = a **segmentally empty prosodic affix** that is filled with ‘copied’ elements of the base it is added to

- not substantially different from segmental affixes: they simply lack segmental content
- a **purely phonological account** without reduplication-specific mechanism or entities like RED or Faith<sub>BR</sub> (McCarthy and Prince, 1995, and subsequent work)
- strong argument for such an approach: **phonologically predictable allomorphy** between reduplication and other non-concatenative strategies like vowel lengthening (Saba Kirchner, 2010, 2013*a,b*; Zimmermann, 2013)

## Reduplication and Prosodic Affixation

- copying is a general phonological repair, modeled as segmental **fission** violating (19-a) (Spaelti, 1997; Struijke, 2000; Gafos, 2003; Nelson, 2003)
- that the otherwise prosodic node is filled with segmental material is ensured by constraints ensuring proper prosodic parsing (19-b)
- alternative strategies to realize the prosodic affix: for example epenthesis, penalized by DEP<sub>S</sub> (19-c)

- (19)
- a. INT<sub>S</sub>: Assign \* to every pair of output segments that correspond to the same input segment.
  - b.  $\mu > S$ : Assign \* to every  $\mu$  not dominating a segment.
  - c. DEP<sub>S</sub>: Assign \* to every output-segment without an input correspondent.

## Copying as Fission: The Basic Mechanism

(20)

	$\mu$	$\mu$		$\mu > S$	DEPS	*V:	INTS						
		$s_1$	$i_2$	$l'_3$									
a.	$\mu$		$\mu$	$s_1$	$i_2$	$l'_3$		*	!				
b.	$\mu$	$\mu$	$\mu$	$\text{?}$	$\text{ə}$	$s_1$	$i_2$	$l'_3$		*	!	*	
c.	$\mu$	$\mu$	$\mu$	$s_1$	$i_2$	$l'_3$					*	!	
d.	$\mu$	$\mu$	$\mu$	$s_1$	$i_2$	$s_1$	$i_2$	$l'_3$					**

## Avoidance and Truncation in a PA Account

- ‘too much’ reduplication is avoided to minimize violations of  $INT_S$  (in spirit similar to an account based on unified indexation (Buckley, 1997; Rose, 1997))
- two possible repairs:
  1. **coalescence of prosodic nodes on the same tier**, under violation of UNIFORMITY (Saba Kirchner, 2010, 65)

(21) UNF- $\mu$ : Assign \* to every pair of input  $\mu$ 's that correspond to the same input  $-\mu$ .

2. **prosodic affixes on different tiers dominate each other**, under violation of DEPAL(X-Y), e.g. (22)

(22) DEP( $\sigma$ - $\mu$ ): Assign \* for every colourless association line between a coloured  $\sigma$  and a  $\mu$ .

## Background Assumption

- **morphological colours** (=morphological affiliation) allows the phonology to identify whether material is epenthetic (=colourless) and whether two elements belong to the same or different morphemes (van Oostendorp, 2003, 2008, 2007; Revithiadou, 2007; Trommer, 2011; Trommer and Zimmermann, 2014; Zimmermann, 2017)
- the stem is **fully prosodified** at the point where affixes are added: a stratal model (Kiparsky, 2011; Bermúdez-Otero, in preparation) with an evaluation prior to concatenation (Trommer, 2011)

# Deriving the Typology

	Reduplication	Pseudoreduplication
<b>A. Multiple reduplication</b>		
1. PA on same tier	Thompson	Ditidaht
2. PA on different tier	Fox	
<b>B. Avoidance</b>		
1. PA on same tier	Ahousaht	Ahousaht
2. PA on different tier	Kyuoqot	
<b>C. Truncation</b>		
1. PA on same tier	?	Manam
2. PA on different tier	Sikaiana	

## Deriving the Typology: Avoidance

# Multiple Prosodic Affixes on the Same Tier

## Multiple reduplication

e.g. Thompson

All  $\mu$ 's filled with segments

→ UNF- $\mu$   $\gg$  INT<sub>S</sub>

## Avoidance

e.g. Ahousaht

Fusion of  $\mu$ 's

→ INT<sub>S</sub>  $\gg$  UNF- $\mu$

# Multiple Reduplicants in Thompson: PA's on the Same Tier

(23)

	$\mu_1 \mu_2 \quad \mu_3 \quad \mu_4 \mu_5$ $s_1 \quad i_2 \quad l'_3$	$\mu > S$	UNF- $\mu$	INTS
a.	$\mu_1 \mu_2 \quad \mu_3 \quad \mu_4 \mu_5$ $s_1 \quad i_2 \quad l'_3 \quad s_1 \quad i_2 \quad s_1 \quad i_2 \quad l'_3$			*****
b.	$\mu_{1,2,3} \quad \mu_4 \mu_5$ $s_1 \quad i_2 \quad s_1 \quad i_2 \quad l'_3$		*!*	**

# Avoidance in Ahousaht: PA's on the Same Tier

(24)

	$\mu_1$	$\mu_2$	$\sigma$ $\mu_3$ $n_1$ $a_2$ $\int_3$ $a_4$	$\sigma$ $\mu_4$ $n_1$ $a_2$ $\int_3$ $a_4$	$MAX_\sigma$	$\mu > S$	DEPS	DEP( $\sigma$ - $\mu$ )	INTS	UNF- $\mu$
a.	$\sigma$ $\mu_1$ $n_1$ $a_2$	$\sigma$ $\mu_2$ $\int_3$ $a_4$	$\sigma$ $\mu_3$ $n_1$ $a_2$ $\int_3$ $a_4$	$\sigma$ $\mu_4$ $n_1$ $a_2$ $\int_3$ $a_4$					***!*	
b.	$\sigma$ $\mu_{1,2}$ $n_1$ $a_2$	$\sigma$ $\mu_3$ $n_1$ $a_2$	$\sigma$ $\mu_4$ $\int_3$ $a_4$						**	*
c.	$\sigma$ $\mu_{1,2,3}$ $n_1$ $a_2$	$\sigma$ $\mu_4$ $\int_3$ $a_4$						*!*		**

## Multiple Prosodic Affixes on Different Tiers

### Multiple reduplication

e.g. Fox

All PA's must be filled with segments

→  $\text{DEP}(\omega\text{-}\sigma) \gg \text{INT}_S$

### Avoidance

e.g. Kyuoquot

PA's dominate each other

→  $\text{INT}_S \gg \text{DEP}(\sigma\text{-}\mu)$

# Multiple Reduplicants in Fox: PA's on Different Tiers

(25)

<p><math>\omega</math></p> <p><math>\sigma</math></p> <p><math>a:8</math>    <math>w_1 i:2</math>    <math>t_3 a_4</math>    <math>m_5 a_6</math>    <math>w_7</math></p>	<p><math>\omega &gt; \sigma</math></p>	<p><math>\sigma &gt; \sigma</math></p>	<p>DEPS</p>	<p>DEP(<math>\omega</math>-<math>\sigma</math>)</p>	<p>INTS</p>

(Simplification:  $\varphi$  excluded; fixed segment is only an underspecified V)

## Avoidance in Kyuquot: PA's on Different Tiers

(26)

		$\mu > S$	DEPs	INTS	DEP( $\sigma - \mu$ )
a.				***!*	
b.				**	**

(simplified structure only showing the stem and the PA triggering reduplication)

## Deriving the Typology: Truncation

## Truncatory Multiple Reduplication in Sikaiana

- the repetitive is an affix consisting of two empty  $\sigma$ 's and the plural an empty  $\mu$
- reduplication or initial gemination for the affixed  $\mu$  becomes necessary since MORPC is high-ranked
- if both prosodic affixes are present, gemination and integration under the affix- $\sigma$  is possible without a violation of MORPC and further reduplication is unnecessary

(27) MORPC: Assign \* to every  $\sigma$  only dominating  $\mu$ 's of another morphological colour.

## Normal Reduplication or Gemination in Sikaiana

(28)

	$\mu > S$	MORPC	*INGEM	INTS

## Deriving the Typology: Pseudoreduplication

## Extension to Pseudoreduplication

- pseudoreduplicated stems have an **exceptional underlying prosodic structure** and lack certain prosodic nodes
- the lack of underlying prosodic structure predicts that the empty affix prosody that usually triggers reduplication can simply dominate the pseudoreduplicated structure
- ➔ the pseudoreduplicated structure is ‘not really there’ and maybe even added later/after the stem stratum

## Pseudoreduplication: Avoidance in Ahousaht

- a pseudoreuplicated structure lacks a  $\sigma$ : fusion of an affixed  $\mu$  and this underlying  $\mu$  hence does not imply a DEP( $\sigma$ - $\mu$ )-violation  
 → the pseudoreuplicated part is treated/behaves like an affix

## Recall: Avoidance in Ahousaht

(30)

$\mu_1$	$\mu_2$		$\mu > S$	DEPS	DEP( $\sigma$ - $\mu$ )	INTS	UNF- $\mu$
a.						***!* !	
b.						**	*
c.					*!* !		**

## Pseudoreduplication: Avoidance in Ahousaht

(31)

		$\mu > \sigma$	DEPS	DEP( $\sigma - \mu$ )	INTS	UNF- $\mu$
a.					*!*	
b.						*

## Pseudoreduplication: Truncation in Manam

- the reduplication-triggering affix is an empty  $\varphi$ -node and reduplication applies since this  $\varphi$ -node can't simply dominate underlying  $\sigma$ 's due to DEP( $\varphi$ - $\sigma$ )
- a pseudoreduplicated structure lacks a  $\sigma$ , an epenthetic  $\sigma$  hence has to be inserted and this can be integrated under the affix prosody without a violation of DEP( $\varphi$ - $\sigma$ )

## Normal Reduplication in Manam

(32)

	$\varphi$	$\varphi > \sigma$	FTBIN	DEP( $\varphi$ - $\sigma$ )	INTS
a.				*!*	
b.					**

## Pseudoreduplication: Truncation in Manam

(33)

	$\varphi$	$\varphi > \sigma$	FTBIN	DEP( $\varphi - \sigma$ )	INTS
a.				*!*	
b.					***!*
c.					**

# BR-Faith Alternative

## Red and Base-Reduplicant Faithfulness

(=BRCT; McCarthy and Prince, 1995, and subsequent work)

- phonologically empty **RED** is the trigger for reduplication: a BR-faithfulness relation between base and reduplicant is established
- crucial: every reduplicative morpheme establishes its own **BR-relation**

(34)

	MAX-BR <sub>DIM</sub>	*CODA	MAX-BR <sub>DIS</sub>
RED <sub>DIS</sub> -sil'			
a. sil		*	**!*
☞ b. si~sil'		*	*
c. sil~sil'		**!	
RED <sub>DIM</sub> -sil'			
a. sil	*!***	*	
b. si~sil'	*!	*	
☞ c. sil~sil'		**	

## BRCT and Avoidance of Multiple Reduplication

- multiple reduplication avoidance follows from a constraint \*DUPDUP (or \*REDRED) that ‘disallow[s] multiple copies’ (Stonham, 2004, 172)
  - it is violated as soon as two reduplicants are in the output: it hence refers to the **exponence type that a phonological element represents**
- = a complex constraint type that sees more than phonological structure (=the presence of a RED-morpheme in the input and the fact that phonological elements in the output represent this RED
- (Note: it can not simply refer to the presence of two different BR-faithfulness relations in the output: those are established as soon as RED is present in the input – non-realization of a reduplicant does not (in most standard BRCT implementations) avoid the BR-relation)

## BRCT and Avoidance of Multiple Reduplication

(35) *No multiple reduplicants in Ahousaht*

RED <sub>Der</sub> -RED <sub>resbl</sub> -naʔa	RED <sub>DER</sub> =μ	*DUPDUP	RED <sub>RESBL</sub> =μ
a. naʔa	*!		*
 b. na~naʔa			*
c. na~na~naʔa		*!	

→ \*DUPDUP predicts that **only a single reduplicant surfaces**

## BRCT and Truncatory Multiple Reduplication

- only possible as a **phonological identity avoidance** effect (Menn and McWhinney, 1984; Yip, 1998)
  - it has to be a **counting constraint** that tolerates 2x an identical string but excludes it if it occurs 3x
    - conjoined  $OCP_{\sigma} \& OCP_{\sigma}$  (Smolensky, 1995; Lubowicz, 2002, 2003)
    - a threshold effect in Harmonic Grammar (Legendre et al., 1990)
- inherently **excludes that pseudoreduplicated words undergo reduplication**: a pattern like Ditidaht where some pseudoreduplicated words can undergo reduplication is impossible

# Conclusion

## Summary

- the typology found in multiple reduplication patterns
  - faithful multiple reduplication
  - avoidance of multiple reduplication
  - truncatory multiple reduplication

follows under a **purely phonological account based on prosodic affixation**

- the crucial mechanism: Different affixed prosodic nodes can ‘fuse’ (=coalescence or prosodic integration) or not; ensured by standard faithfulness constraints
