Being (slightly) stronger: Lexical stress in Moses Columbian Salish

Strength in Grammar November 11th, 2017 Eva Zimmermann Leipzig University

UNIVERSITÄT LEIPZIG

- the assumption of Gradient Symbolic Representations predicts the lexical stress system in Moses Columbia Salish as competition between elements with different degrees of activity
- the complexity of the lexical stress pattern in Moses Columbia Salish can not follow as competition in a system that only allows a binary distinction into strong-weak
- such a representational account correctly predicts that elements with different activity behave exceptional for more than one process

1. Gradient Symbolic Representations

- 2. Case study: Moses Columbia Salish Stress
- 2.1 Data: Lexical stress in MCS
- 2.2 Analysis based on gradient activity
- 2.3 Further evidence: Vowel deletion asymmetries

3. Summary and Conclusion

Gradient Symbolic Representations

Background: Gradient Symbolic Representation (=GSR; Smolensky and Goldrick, 2016; Rosen, 2016)

- symbols in a linguistic representation can have different degrees of presence or numerical activities
- this can predict lexical exceptions: elements in the underlying representation of a morpheme can be exceptionally weak
- assumption modifying the original GSR-account: output elements can be weakly active as well (Zimmermann, 2017*a*,*b*; Faust, 2017; Nformi and Worbs, 2017): GSRO (no explicit argument for this assumption in the MCS analysis)

Gradient Symbolic Representations and HG

- any change in activity is a faithfulness violation
- every marked structure M violates a markedness constraint by the number that equals M's activity
- grammatical computation inside Harmonic Grammar (Legendre et al., 1990; Potts et al., 2010)

b ₁ a	₁ t ₁ -p _{0.5}	*CC] _σ	Dep	Max	
		3	2	1	
a.	$b_1a_1t_1p_{0.5}$	-0.5			-1.5
r☞ b.	b ₁ a ₁ t ₁			-0.5	-0.5
с.	b ₁ a ₁ p _{0.5}			-1	-1
d.	$b_1a_1t_1 \eth_1p_{0.5}$		-1		-2
e.	$b_1a_1t_1p_1$	-1	-0.5		-4

Gradience in the output: Predicted typology of exceptions

Underlying	Рнол.	Output	e.g.
1. Exceptional			
$A_1 + B_{0.6}$	*AB	A ₁	Nuuchahnulth unstable C's (Kim, 2003)
$A_1 + B_1$		A_1B_1	
2. Exceptional	repair: W	eak element	realized
$A_1 B_{0.6} + A_1$	*AA	A ₁ B _{0.6} A ₁	Catalan exceptional u-realization (Bonet et al., 2007)
$A_1 B_{0.6} + C_1$		A_1C_1	Catalan exceptional u-realization (Bonet et al., 2007)
3. Exceptional	non-trigg	er: Weak ele	ement not repaired
$A_1 + B_{0.6}$	*AB	A ₁ B _{0.6}	Cl. Manchu exceptional non-triggers for ATR-harmony (Smith, 2017)
$A_1 + B_1$		A_1C_1	ATR-harmony (Smith, 2017)
4. Exceptional	non-targe	et: Weak elei	ment does not change
$A_1^A + B_{0.6}$	*X ^A	A ₁ B _{0.6}	SMG Mixtec exceptional non-hosts for floating tones; GSRO analysis in (Zimmermann, 2017 <i>a,b</i>)
$A_1^A + B_1$		A_1A_1	tones; GSRO analysis in (Zimmermann, 2017 <i>a,b</i>)
5. Lexical supp			
A ₁ B _{0.6}	*Weaк!	A ₁	Japanese Rendaku voicing only if stem and suffix
$A_1 B_{0.6} \\ A_1 B_{0.6} + B_{0.6}$		A ₁ B _{0.6}	trigger it; GSR analysis in Rosen (2016)
6. True compe			
$A_{0.8} + C_1$	1Elem!	C ₁	→ MCS case study
$A_{0.8} + B_{0.6}$		A _{0.8}	→ MCS case study

Argument 1: More than two grades of activity

- in most accounts that directly implement some concept of strength, only a binary division into strong and weak is relevant (Inkelas, 2015; Vaxman, 2016*a,b*; Sande, 2017)
- → true gradience of activity is argued to account for the stress system of Moses Columbia Salish where feet with 5 different degrees of activity compete for realization

Argument 2: Exceptionality for more than one process

- such a representational account where exceptionality follows from a property of the underlying representation predicts that elements can be exceptional for multiple phonological processes
- borne out in the case study of MCS where vowel deletion treats the same morpheme types differently as stress assignment

э

Moses Columbia Salish

(Kinkade, 1982; Czaykowska-Higgins, 1985, 1993*a*,*b*, 2011; Willett, 2003, =MCS)

- a single main-stressed syllable in every word
- the default-stress position is the rightmost syllable for stems in isolation (3-a+b)
- prefixes are never stressed; even if they contain the only full V (3-c)
- (3) Default stress (Czaykowska-Higgins, 1993a, 205+225)
 - a. hananík 'jackrabbit'
 - b. q'aláχ 'fence'
 - c. ni?wəpwə́pəlqs ni?-wp~wp=lqs Loc-Red-hair=nose 'hair in nose'

Vowel epenthesis and deletion

- there is vowel epenthesis:
 - e.g. weak CC-roots always have an epenthetic V between stem-C's
 - e.g. epenthesis before /?/
 - quality predictable: e.g. i/__j, a/__?, a elsewhere,...)
 - (4) nq'ij'apána?
 n-q'j'=ap=an?
 Loc-write=bottom=ear
 'branded on the cheek' (215)
- unstressed V's are deleted if they follow the stressed V
 - (5) ka∫ħújtſnmncn ka∫-<u>ħuj</u>=tſin-min-t-∫i-n unrealized-irritate=mouth-relational-TR-2Sc.O-1Sc.S 'I'm going to bother you (by mouth)' (202)

(stem=underlined)

Lexically determined stress in Salish

- hierarchy of stress-preferences based on a lexical two-way-distinction for stems and affixes into:
 - dominant 'D' and recessive 'R' suffixes
 - strong 'S' and weak 'W' stems
 - $\Rightarrow D-Sfx \gg S-stem \gg \{R-Sfx, W-stem\}$
- very similar systems in all Interior Salishan languages except Lillooet (Idsardi, 1991; Czaykowska-Higgins and Kinkade, 1998; Revithiadou, 1999)

Lexically determined stress in MCS

(6)

- a. p'i∫t<u>t</u>'a?ák∫t <u>p'i∫tt'?</u>=ak∫t big.PL=hand 'big hands' (229)
- b. ∫aţſím'xəx^w
 ∫aţſ-<u>?im'x</u>-mix
 IPFV-move-IPFV
 'he's moving' (208)
- c. ∫atʃím'xəx^w
 ka∫-<u>p'iq</u>=tʃin-tʃut-mix
 unrealized-cook=food-REFL-IPFV
 'he's going to cook' (209)

(S-**Ď**)

(**Ś**-R)

(S-**Ď**-R)

Further distinction for stems: E-stems

- E-stems are stressed if directly followed by one D-suffix
- > but loose stress to a D-suffix if at least one other suffix intervenes

(7)	a.	japk ^w ánk∫n	(<mark>SÉ</mark> -D)
		jap- <u>k^wan</u> =ak∫t-n-t-ø-n	
		Loc-grab=hand-Ctrl-Tr-3.O-1Sg.S	
		'I grab so. by the hand' (229)	
	b.	kłk ^w nt∫nák∫n	(SE-D- <mark>Ď</mark>)
		kł-k ^w an=t∫in=ak∫t-n-t-ø-n	· · · ·
		Loc-grab=mouth=hand-Ctrl-Tr-3.O-1Sc.S	
		'I grab so. by wrist' (231)	
	c.	xatm∫tʃút	(SE-R- <mark>Ď</mark>)
		xat-min-∫tu-t∫ut	
		raise-relational-CAUS-REFL	
		ʻhe's raising up' (271)	

Lexically determined stress: Interim summary

(8)

	S	W	SE	WE
a.	Ś (-R)-R	W(-R)- <mark>Ŕ</mark>	<mark>SÉ</mark> (-R)-R	WÉ-R
b.	S-Ď	W- <mark>Ď</mark>	<mark>SÉ</mark> -D	WÉ-D
c.	S- <mark>Ď</mark> -R(-R)	W- <mark>Ď</mark> -R(-R)	<mark>SÉ</mark> -D-R(-R)	
d.	S-D(-D)- <mark>Ď</mark>	W-D(-D)- <mark>Ď</mark>	SE-D(-D)- <mark>Ď</mark>	WE-D(-D)- <mark>Ď</mark>
e.			SE-R- <mark>Ď</mark>	

Asymmetry: Intervening suffix between E-stem and D or not

- * hierarchy: $\underline{SE/WE} \sim \underline{D} \gg S \gg \{R, W\}$
- multiple suffixes of the type that should be stressed: the rightmost one receives stress

Additional suffix-type R*: Stress-attracting R-suffixes

- two suffixes behave like R-suffixes except that they attract stress even though they are not the rightmost in a sequence of R-suffixes
- k^wúłnmn (9) (**Ś**-R*) a. k^wu⁴n-min-t-ø-n borrow-relational-CTR-TR-3.O-1Sc.S 'I'm borrowing it' (251) (W-D-**D**-R*) b. t∫qəna?qímnt∫n t∫q=an?=qin-min-t-∫i-n hear=ear=head-relational-TR-2SG.O-1SG.S 'I heard about you' (251) (W-**Ŕ***-R) jərmí∫tm с. jr-min-∫tu-ø-n push-relational-CAUS-3.O-1PL.S 'We push him' (252)

Additional suffix-type D*: Stress-attracting D-suffixes

D*-suffixes behave like D-suffixes except that they are stressed when adjacent to an SE/WE-stem

(10)	a.	ptχujútija?∫n <u>ptiχuj</u> =utj?-∫tu-ø-n spit=?-CAUS-3.O-1SG.S 'I spittled on them' (270)	(S -Ď *-R)
	b.	wak ^w túłn <u>wak^w</u> -tuł-t-ø-n hide-redirective-Tr-3.O-1Sc.S 'I hid it from s.o.' (256)	(SE- <mark>Ó</mark> *)
	c.	t'əɬwíl'x <u>t'</u> ŧ-wil'x dirty-inch 'sth. used until it got dirty' (256)	(WE- <mark>Ó</mark> *)

D* vs. D and R* vs. R

Summary: The challenges

Iexical stress system with a preference hierarchy: D* ≫ SE/WE ~ D ≫ S ≫ R* ≫ {R, W}

 an apparent locality threshold for E-stems: only stressed if no D-suffix follows separated by at least one other suffix

< □ > < 向

A cyclic account in Czaykowska-Higgins (1993*a*)

- a cyclic account inside the metrical framework of Halle and Vergnaud (1987*a*,*b*)
- crucial contrast: cyclic (=D) vs. non-cyclic (=R) suffixes: the former trigger stress deletion and new assignment of stress
- different stress rules assigning left- or rightmost stress
- E-stems assign extrametricality to an adjacent morphemes
- R*- and D*-suffixes are lexically accented

An OT-account in Revithiadou (1999)

- analysis in a system where conflicts between lexical accents are resolved with reference to morphological structure: the accent of the morphological head wins (HDFAITH >> FAITH)
- asymmetry for suffixes then follow from their different morphological structure (=lexical suffixes are part of a compound or predicate structure)
- → not the aim to derive all the data we saw, including 'exceptions'/small classes of only a few morphemes
- → full set of data impossible to derive since it is again a binary division: morphological head vs. non-head

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ =

Analysis based on gradient activity

Image: A matrix and a matrix

The analysis in a nutshell: Competition

 morphemes have no or underlying feet of different strengths in their underlying representation (difference between strong/weak stems = underlying V/only epenthetic V)

(12)

Fully a	active φ		Νο φ				
SE/	/WE	D*	D	S	R*	R/	W
φ1	φ1	φ0.9	φ0.8	φ0.6	φ0.4		
SE	WE	D*	D	S	R*	R	W

The analysis in a nutshell: Competition

 morphemes have no or underlying feet of different strengths in their underlying representation (difference between strong/weak stems = underlying V/only epenthetic V)

(12)

Fully a	active φ		$\leftarrow Weaker \ \phi \rightarrow$					
SE/WE D*			D	S	R*	R/	W	
φ1	φ1	φ0.9	φ _{0.8}	φ0.6	φ0.4			
SE WE D*			D	S	R*	R	W	

- competition for φ-realization: most active one is preferably realized
- (13) Max-φ: Assign a violation mark for every input φ without an output correspondent.

Two other (opposing) stress preferences

- (14) a. V_{STEM} ('Stress the stem-vowel!')
 Assign a violation mark for every main-stressed vowel that is not preceded and followed by stem-segments.
 - RM_{COL} ('Stress is rightmost!')
 Assign a violation mark for every morphemic colour α that intervenes between the right word edge and the stressed vowel that is not of morphemic colour α.
 - c. RM_V ('Stress is rightmost!')

Assign a violation mark for every \hat{V} that intervenes between the right word edge and the stressed vowel that is not of morphemic colour α .

→ two versions of RIGHTMOST: asymmetry between R- and D-suffixes and abundant V-deletion in Salish

> (*Underlying vowel. Modelled in containment theory (Prince and Smolensky, 1993; Zimmermann, 2017c)).

Two other (opposing) stress preferences

- a. V_{STEM} ('Stress the stem-vowel!')
 Assign a violation mark for every main-stressed vowel that is not preceded and followed by stem-segments.
 - RM_{COL} ('Stress is rightmost!')
 Assign a violation mark for every morphemic colour α that intervenes between the right word edge and the stressed vowel that is not of morphemic colour α.
 - c. RM_V ('Stress is rightmost!')

Assign a violation mark for every $V^{\hat{}}$ that intervenes between the right word edge and the stressed vowel that is not of morphemic colour α .

→ two versions of RIGHTMOST: asymmetry between R- and D-suffixes and abundant V-deletion in Salish

> (*Underlying vowel. Modelled in containment theory (Prince and Smolensky, 1993; Zimmermann, 2017c)).

→ gang-effect in HG for E-stems: stems are preferably stressed but stress can't be too far away from the right word-edge

Realization of the only underlying ϕ

	SE	WE	D*	D	S	R*	R	W	

this representational account predicts exceptional behaviour of weakly active elements for more than one process:

→ evidence from facts about vowel deletion/secondary stress that these is indeed the case

Image: A matched block of the second seco

Further evidence: Vowel deletion asymmetries

< □ > < 同 >

Vowel deletion asymmetry: E-stems and D-suffixes

unstressed V's are sometimes deleted if they precede the stressed V

- the unstressed V of a D-suffix is deleted between an SE-stem and a stressed D-suffix (20-a)
- but the unstressed V of a D-suffix is only variably/for some speakers deleted between a W-stem and a stressed D-suffix (20-b)
- (20) a. kłţj°awlq^wqnák∫tm kł-<u>ţj°aw=al</u>q^w=qin=ak∫t-m Loc-wash=pole=Top=arm-MiD 'wash wrists' (246)
 - b. kjər'jər'qnalq^wák∫tn
 k-jr'~j<u>r</u>'=qin=alq^w=ak∫t-n-t-ø-n

 'roll up sleeves' (245)

 $(W\text{-}D_{V/\varnothing}\text{-}D_{V/\varnothing}\text{-}\acute{D})$

Secondary stress

- optional secondary stress can be found on:
 - stem vowels
 - suffix vowels preceding the main stress
 - → in the context where vowel deletion applies optionally
- (21) a. ni?k'əmàn'kàkst ni?-<u>k'm</u>=ank=akst Loc-surface.of=flat=hand 'palm of hand' (246)
 - nməq'^wàpána?
 n-<u>mq'^w</u>=ap=an?
 Loc-bulge=base=ear
 'bulge on side of face' (249)

 $(W-\dot{D}_{V/\varrho}-\dot{D})$

 $(W-\dot{D}_{V/\varrho}-\dot{D})$

Secondary stress

- optional secondary stress can be found on:
 - stem vowels
 - suffix vowels preceding the main stress
 - → in the context where vowel deletion applies optionally
- (21) a. ni?k'əmàn'kàkst ni?-<u>k'm</u>=ank=akst Loc-surface.of=flat=hand 'palm of hand' (246)
 - nməq'^wàpána?
 n-<u>mq'^w</u>=ap=an?
 Loc-bulge=base=ear
 'bulge on side of face' (249)

 $(W-\dot{D}_{V/\varrho}-\dot{D})$

 $(W-\dot{D}_{V/\varrho}-\dot{D})$

secondary stress is what saves those vowels from deletion!

Account: Second foot blocks vowel deletion

 suffix-vowels without main stress can optionally be realized if they are integrated into a foot (=secondary stress)

Possibility of a second foot in a word

- implicit assumption so far: feet compete for realization since only a single foot is possible (consequence from, for example, ER-L/R (McCarthy, 2003))
- if the responsible constraint is (at least optionally) lower-weighted two feet in a word are possible:
 - avoids vowel deletion of unstressed affix-V
 - is better for Max-φ because more feet are realized
 - but is only possible if the secondary-stress φ is not stronger than the main-stress φ (*AsymmetricStrengthφ)
 - and maximally two feet in a word are possible

Possibility of a second foot in a word

(23)	SE-D-D	₩- D -(C-)D							
	1. Underlying

Evo Zimme	armann (Leinzig University)	Strength in Cramma							

Eva Zimmermann (Leipzig University)

Only the stronger foot can become a secondary stress

 a second foot can 'save' a D-suffix-V following a W-stem but not one following an SE-stem: being able to save a suffix-vowel from deletion is not a good enough reason to realize the weaker φ

$\begin{array}{cccc} \varphi_1 & \varphi_{0.8} & \varphi_{0.8} \\ \sigma & \sigma & \sigma \\ \mathbf{x'^{w}ir} & \mathbf{ak} \mathbf{\mathbf{\int}} \mathbf{t} & \mathbf{atk^{w}} \end{array}$	Мах-ф 100	Max-V 10	
$ \begin{array}{c c} \varphi_1 & \varphi_{0.8} \\ \hline {}^{\mu \varpi} a. & \sigma & \sigma \\ & x'^{w} irk \int tat k^w \end{array} $	-0.8	-1	-90
b. σ σ σ x' ^w i rak∫ tatk ^w	-1		-100

(24)

Only the stronger foot can become a secondary stress

 a second foot can 'save' a D-suffix-V following a W-stem but not one following an SE-stem: being able to save a suffix-vowel from deletion is not a good enough reason to realize the weaker φ

$ \begin{array}{c cccc} \phi_1 & \phi_{0.8} & \phi_{0.8} \\ \sigma & \sigma & \sigma \\ \mathbf{x'^{w}ir} & ak \mathbf{\int} t & at k^{w} \end{array} $	Μах-φ	Max-V	
	100	10	
$[\begin{tabular}{ccc} & \phi_1 & \phi_{0.8} \\ \hline \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \$	-0.8	-1	-90
b. σ σ σ x ^{?w} i rak∫ tatk ^w	-1		-100

 again, simple competition about which φ is realized; only in another domain (=secondary stress and avoidance of vowel deletion)

(24)

Summary and Conclusion

Eva Zimmermann (Leipzig University)

Strength in Grammar 40 / 46

Image: A matrix and a matrix

Summary

- lexical stress system in MCS follows from assuming 6 different types of underlying foot structure for morphemes
 - position of main stress follows from competition about φ-realization
 - exceptionality of E-stems is a threshold-effect in HG

< □ > < / >

Summary

- lexical stress system in MCS follows from assuming 6 different types of underlying foot structure for morphemes
 - position of main stress follows from competition about φ-realization
 - exceptionality of E-stems is a threshold-effect in HG
- this representational account also predict exceptional behaviour for vowel deletion: exceptionality for multiple processes

(=argument against lexically indexed constraints (e.g. Alderete, 2001; Pater, 2009; Finley, 2009): It is a coincidence that at least two different constraints are indexed to the same class of (exceptional) morphemes)

Summary

- lexical stress system in MCS follows from assuming 6 different types of underlying foot structure for morphemes
 - position of main stress follows from competition about φ-realization
 - exceptionality of E-stems is a threshold-effect in HG
- this representational account also predict exceptional behaviour for vowel deletion: exceptionality for multiple processes

(=argument against lexically indexed constraints (e.g. Alderete, 2001; Pater, 2009; Finley, 2009): It is a coincidence that at least two different constraints are indexed to the same class of (exceptional) morphemes)

the argument for GSR(O) is strengthened in showing that this predicted type of exceptionality is borne out as well

(日)

Gradience in the output: Predicted typology of exceptions

Conflicting directionality

- * if a root only contains epenthetic vowels, the leftmost is stressed
- (not uncommon in Interior Salishan, a similar pattern in Thompson River Salish (Thompson and Thompson, 1992; Coelho, 2002))
- (25) Leftmost stress in epenthesis-only words

a.	sq'íj'q'ijs	(₩ -R)
	s-q'j-q'j-s	
	NMLz-write-characteristics-Poss	
	'his/its/her writing' (222)	
b.	k'áməlqstxən	(W -R-R)
	k'm=lqst=xn	
	surface.of=shin=leg	
	'lower leg' (222)	

The analysis in a nutshell: Morphological affiliation

- apparent conflicting directionality follows from contrast between coloured/epenthetic material: There is a preference for stems to be stressed and RM_V does not count epenthetic vowels
- (26) RM_V:

Assign a violation mark for every non-epenthetic vowel that intervenes between the right word edge and a stressed vowel.

Conflicting directionality

- in the absence of underlying stress, default rightmost stress is predicted (27-a)
- if there are no underlying vowels, leftmost stress on the stem is predicted since V_{STEM} prefers leftmost stress and no violations of RM_V are induced by potentially following epenthetic vowels (27-b)
- additionally, epenthesis 'inside' affix material is worse than epenthesis 'inside' stem material [2ex]
- (27) *Conflicting Directionality' = the invisibility of epenthetic vowels*

...has a higher weight than...
$$\acute{V}_{STEM}$$
 + $*EP_{AFFX} \gg 2 \times RM_{CoL}$ (28)

W and R: no underlying vowels

(28)
